Deep learning

2. Feedback from rating information → Non-i.i.d.

Collaborative deep learning (CDL)

Contribution

- Collaborative deep learning:

- * deep learning for non-i.i.d. data
- * joint representation learning and collaborative filtering

Contribution

- Collaborative deep learning
- Complex target:
 - * beyond targets like classification and regression
 - * to complete a low-rank matrix

Contribution

- Collaborative deep learning
- Complex target
- First hierarchical Bayesian models for deep hybrid recommender system

Stacked Denoising Autoencoders (SDAE)

SDAE solves the following optimization problem:

$$\min_{\{\mathbf{W}_l\}, \{\mathbf{b}_l\}} \|\mathbf{X}_c - \mathbf{X}_L\|_F^2 + \lambda \sum_l \|\mathbf{W}_l\|_F^2,$$

where λ is a regularization parameter and $\|\cdot\|_F$ denotes the Frobenius norm.

Probabilistic Matrix Factorization (PMF)

Graphical model:

Notation:

- $\bigcirc V_j$ latent vector of item j
- $\bigcirc U_i$ latent vector of user i
- $\bigcirc R_{ij}$ rating of item j from user i

Generative process:

$$p(U|\sigma_U^2) = \prod_{i=1}^N \mathcal{N}(U_i|0, \sigma_U^2 \mathbf{I}) \quad p(V|\sigma_V^2) = \prod_{j=1}^M \mathcal{N}(V_j|0, \sigma_V^2 \mathbf{I})$$

$$p(R|U, V, \sigma^2) = \prod_{i=1}^N \prod_{j=1}^M \left[\mathcal{N}(R_{ij}|U_i^T V_j, \sigma^2) \right]^{I_{ij}}$$

Objective function if using MAP:

$$E = \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^M I_{ij} (R_{ij} - U_i^T V_j)^2 + \frac{\lambda_U}{2} \sum_{i=1}^N \|U_i\|_{Fro}^2 + \frac{\lambda_V}{2} \sum_{j=1}^M \|V_j\|_{Fro}^2$$

[Salakhutdinov et al. 2008]

Probabilistic SDAE

Graphical model:

Generative process:

$$W_{l,*n} \sim \mathcal{N}(0, \lambda_w^{-1} \mathbf{I}_{K_l})$$

$$\mathbf{b}_l \sim \mathcal{N}(0, \lambda_w^{-1} \mathbf{I}_{K_l})$$

$$X_{l,j*} \sim \mathcal{N}(\sigma(X_{l-1,j*} W_l + \mathbf{b}_l), \lambda_s^{-1} \mathbf{I}_{K_l})$$

$$X_{c,j*} \sim \mathcal{N}(X_{L,j*}, \lambda_n^{-1} \mathbf{I}_B)$$

Generalized SDAE

Notation:

- $\textcircled{\text{gray}} X_0$ corrupted input
- $\textcircled{\text{gray}} X_c$ clean input
- $\textcircled{\text{white}} W^+$ weights and biases

Collaborative Deep Learning (CDL)

Graphical model:

Two-way interaction

- More powerful representation
- Infer missing ratings from content
- Infer missing content from ratings

Notation:

- | | |
|--------------------------------------|----------------------------------|
| R rating of item j from user i | x_0 corrupted input |
| v latent vector of item j | x_c clean input |
| u latent vector of user i | W^+ weights and biases |
| | $x_{L/2}$ content representation |

A Principled Probabilistic Framework (Recap)

Perception Component

Task-Specific Component

CDL with Two Components

Graphical model:

Two-way interaction

- More powerful representation
- Infer missing ratings from content
- Infer missing content from ratings

Notation:

$\mathbf{R}$ rating of item j from user i	$\mathbf{x}_0$ corrupted input
$\mathbf{v}$ latent vector of item j	$\mathbf{x}_c$ clean input
$\mathbf{u}$ latent vector of user i	$\mathbf{W}^+$ weights and biases
	$\mathbf{x}_{L/2}$ content representation

Collaborative Deep Learning

Neural network representation for **degenerated** CDL

Collaborative Deep Learning

Collaborative Deep Learning

Collaborative Deep Learning

Learning

maximizing the posterior probability is equivalent to maximizing the joint log-likelihood

$$\begin{aligned}
 \mathcal{L} = & -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2) \\
 & -\frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - \mathbf{X}_{\frac{L}{2},j*}^T\|_2^2 - \frac{\lambda_n}{2} \sum_j \|\mathbf{X}_{L,j*} - \mathbf{X}_{c,j*}\|_2^2 \\
 & -\frac{\lambda_s}{2} \sum_l \sum_j \|\sigma(\mathbf{X}_{l-1,j*} \mathbf{W}_l + \mathbf{b}_l) - \mathbf{X}_{l,j*}\|_2^2 \\
 & - \sum_{i,j} \frac{\mathbf{C}_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2.
 \end{aligned}$$

Learning

Prior (regularization) for user latent vectors, weights, and biases

$$\begin{aligned}
 \mathcal{L} = & -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2) \\
 & -\frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - \mathbf{X}_{\frac{L}{2},j*}^T\|_2^2 - \frac{\lambda_n}{2} \sum_j \|\mathbf{X}_{L,j*} - \mathbf{X}_{c,j*}\|_2^2 \\
 & -\frac{\lambda_s}{2} \sum_l \sum_j \|\sigma(\mathbf{X}_{l-1,j*} \mathbf{W}_l + \mathbf{b}_l) - \mathbf{X}_{l,j*}\|_2^2 \\
 & - \sum_{i,j} \frac{\mathbf{C}_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2.
 \end{aligned}$$

Learning

Generating item latent vectors from content representation with Gaussian offset

$$\mathcal{L} = -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2)$$

$$-\frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - \mathbf{X}_{\frac{L}{2}, j*}^T\|_2^2 - \frac{\lambda_n}{2} \sum_j \|\mathbf{X}_{L, j*} - \mathbf{X}_{c, j*}\|_2^2$$

$$-\frac{\lambda_s}{2} \sum_l \sum_j \|\sigma(\mathbf{X}_{l-1, j*} \mathbf{W}_l + \mathbf{b}_l) - \mathbf{X}_{l, j*}\|_2^2$$

$$-\sum_{i,j} \frac{\mathbf{C}_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2.$$

Learning

‘Generating’ clean input from the output of probabilistic SDAE with Gaussian offset

$$\begin{aligned}
 \mathcal{L} = & -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2) \\
 & - \frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - \mathbf{X}_{\frac{L}{2},j*}^T\|_2^2 - \boxed{\frac{\lambda_n}{2} \sum_j \|\mathbf{X}_{L,j*} - \mathbf{X}_{c,j*}\|_2^2} \\
 & - \frac{\lambda_s}{2} \sum_l \sum_j \|\sigma(\mathbf{X}_{l-1,j*} \mathbf{W}_l + \mathbf{b}_l) - \mathbf{X}_{l,j*}\|_2^2 \\
 & - \sum_{i,j} \frac{\mathbf{C}_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2.
 \end{aligned}$$

Learning

Generating the input of Layer l from the output of Layer $l-1$ with Gaussian offset

$$\mathcal{L} = -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2) \\ - \frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - \mathbf{X}_{\frac{L}{2},j*}^T\|_2^2 - \frac{\lambda_n}{2} \sum_j \|\mathbf{X}_{L,j*} - \mathbf{X}_{c,j*}\|_2^2$$

$$- \frac{\lambda_s}{2} \sum_l \sum_j \|\sigma(\mathbf{X}_{l-1,j*} \mathbf{W}_l + \mathbf{b}_l) - \mathbf{X}_{l,j*}\|_2^2$$

$$- \sum_{i,j} \frac{\mathbf{C}_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2.$$

Learning

measures the error of predicted ratings

$$\begin{aligned}
 \mathcal{L} = & -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2) \\
 & -\frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - \mathbf{X}_{\frac{L}{2},j*}^T\|_2^2 - \frac{\lambda_n}{2} \sum_j \|\mathbf{X}_{L,j*} - \mathbf{X}_{c,j*}\|_2^2 \\
 & -\frac{\lambda_s}{2} \sum_l \sum_j \|\sigma(\mathbf{X}_{l-1,j*} \mathbf{W}_l + \mathbf{b}_l) - \mathbf{X}_{l,j*}\|_2^2 \\
 & - \sum_{i,j} \frac{C_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2.
 \end{aligned}$$

Learning

If λ_s goes to infinity, the likelihood simplifies to

$$\begin{aligned}\mathcal{L} = & -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2) \\ & - \frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - f_e(\mathbf{X}_{0,j*}, \mathbf{W}^+)^T\|_2^2 \\ & - \frac{\lambda_n}{2} \sum_j \|f_r(\mathbf{X}_{0,j*}, \mathbf{W}^+) - \mathbf{X}_{c,j*}\|_2^2 \\ & - \sum_{i,j} \frac{\mathbf{C}_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2,\end{aligned}$$

Update Rules

For U and V, use block coordinate descent:

$$\mathbf{u}_i \leftarrow (\mathbf{V}\mathbf{C}_i\mathbf{V}^T + \lambda_u\mathbf{I}_K)^{-1}\mathbf{V}\mathbf{C}_i\mathbf{R}_i$$

$$\mathbf{v}_j \leftarrow (\mathbf{U}\mathbf{C}_j\mathbf{U}^T + \lambda_v\mathbf{I}_K)^{-1}(\mathbf{U}\mathbf{C}_j\mathbf{R}_j + \lambda_v f_e(\mathbf{X}_{0,j*}, \mathbf{W}^+)^T)$$

For W and b, use a modified version of backpropagation:

$$\nabla_{\mathbf{W}_l} \mathcal{L} = -\lambda_w \mathbf{W}_l$$

$$- \lambda_v \sum_j \nabla_{\mathbf{W}_l} f_e(\mathbf{X}_{0,j*}, \mathbf{W}^+)^T (f_e(\mathbf{X}_{0,j*}, \mathbf{W}^+)^T - \mathbf{v}_j)$$

$$- \lambda_n \sum_j \nabla_{\mathbf{W}_l} f_r(\mathbf{X}_{0,j*}, \mathbf{W}^+) (f_r(\mathbf{X}_{0,j*}, \mathbf{W}^+) - \mathbf{X}_{c,j*})$$

$$\nabla_{\mathbf{b}_l} \mathcal{L} = -\lambda_w \mathbf{b}_l$$

$$- \lambda_v \sum_j \nabla_{\mathbf{b}_l} f_e(\mathbf{X}_{0,j*}, \mathbf{W}^+)^T (f_e(\mathbf{X}_{0,j*}, \mathbf{W}^+)^T - \mathbf{v}_j)$$

$$- \lambda_n \sum_j \nabla_{\mathbf{b}_l} f_r(\mathbf{X}_{0,j*}, \mathbf{W}^+) (f_r(\mathbf{X}_{0,j*}, \mathbf{W}^+) - \mathbf{X}_{c,j*})$$

Content information

Collaborative Deep Learning for Recommender Systems

ABSTRACT

Collaborative filtering (CF) is a successful approach commonly used by many recommender systems. Conventional CF-based methods use the ratings given to items by users as the sole source of information for learning to make recommendations. However, the ratings are often very sparse in many applications, causing CF-based methods to degrade significantly in their recommendation performances. To address this sparsity problem, auxiliary information such as item content information may be utilized. Collaborative topic regression (CTR) is an appealing recent method taking this approach which tightly couples the two components that learn from two different sources of information. Nevertheless, the latent representation learned by CTR may not be very effective when the auxiliary information is very sparse. To address this problem, we generalize recent advances in deep learning from i.i.d. input to non-i.i.d. (CF-based) input and propose in this paper a hierarchical Bayesian model called collaborative deep learning (CDL), which jointly performs deep representation learning for the content information and collaborative filtering for the ratings (feedback) matrix. Extensive experiments on three real-world datasets from different domains show that CDL can significantly advance the state of the art.

ABSTRACT

Collaborative filtering (CF) is a successful approach commonly used by many recommender systems. Conventional CF-based methods use the ratings given to items by users as the sole source of information for learning to make recommendations. However, the ratings are often very sparse in many applications, causing CF-based methods to degrade significantly in their recommendation performances. To address this sparsity problem, auxiliary information such as item content information may be utilized. Collaborative topic regression (CTR) is an appealing recent method taking this approach which tightly couples the two components that learn from two different sources of information. Nevertheless, the latent representation learned by CTR may not be very effective when the auxiliary information is very sparse. To address this problem, we generalize recent advances in deep learning from i.i.d. input to non-i.i.d. (CF-based) input and propose in this paper a hierarchical Bayesian model called collaborative deep learning (CDL), which jointly performs deep representation learning for the content information and collaborative filtering for the ratings (feedback) matrix. Extensive experiments on three real-world datasets from different domains show that CDL can significantly advance the state of the art.

Fantastic Four (2015)

PG-13 | 106 min | Action, Adventure, Sci-Fi | 7 August 2015 (USA)

Not yet released

(voting begins after release)

Four young outsiders teleport to an alternate and dangerous universe which alters their physical form in shocking ways. The four must learn to harness their new abilities and work together to save Earth from a former friend turned enemy.

Titles and abstracts Titles and abstracts

Movie plots

[Wang et al. 2011]
[Wang et al. 2013]

Evaluation Metrics

Recall:

$$\text{recall}@M = \frac{\text{number of items that the user likes among the top } M}{\text{total number of items that the user likes}}$$

Mean Average Precision (mAP):

$$mAP = \frac{\sum_{q=1}^Q AveP(q)}{Q}$$

$$AveP = \frac{\sum_{k=1}^n (P(k) \times rel(k))}{\text{number of relevant items}}$$

Higher recall and mAP indicate better recommendation performance

Comparing Methods

- **CMF**: Collective Matrix Factorization (Singh et al. 2008) is a model incorporating different sources of information by simultaneously factorizing multiple matrices.
- **SVDFeature**: SVDFeature (Chen et al. 2012) is a model for feature-based collaborative filtering.
- **DeepMusic**: DeepMusic (Oord et al. 2013) is a model for music recommendation.
- **CTR**: Collaborative Topic Regression (Wang et al. 2011) is a model performing topic modeling and collaborative filtering simultaneously.

Hybrid methods using **BOW** and ratings

Loosely coupled; interaction is not **two-way**

PMF+**LDA**

Recall@M

When the ratings are **very sparse**:

citeulike-t, sparse setting

Netflix, sparse setting

When the ratings are **dense**:

citeulike-t, dense setting

Netflix, dense setting

Mean Average Precision (mAP)

	<i>citeulike-a</i>	<i>citeulike-t</i>	<i>Netflix</i>
CDL	0.0514	0.0453	0.0312
CTR	0.0236	0.0175	0.0223
DeepMusic	0.0159	0.0118	0.0167
CMF	0.0164	0.0104	0.0158
SVDFeature	0.0152	0.0103	0.0187

Exactly the same as Oord et al. 2013, we set the cutoff point at 500 for each user.

A relative performance boost of about 50%

Number of Layers

Sparse Setting

#layers	1	2	3
<i>citeulike-a</i>	27.89	31.06	30.70
<i>citeulike-t</i>	32.58	34.67	35.48
<i>Netflix</i>	29.20	30.50	31.01

Dense Setting

#layers	1	2	3
<i>citeulike-a</i>	58.35	59.43	59.31
<i>citeulike-t</i>	52.68	53.81	54.48
<i>Netflix</i>	69.26	70.40	70.42

The best performance is achieved when the number of layers is **2 or 3** (**4 or 6** layers of generalized neural networks).

Summary: Collaborative Deep Learning

- Non-i.i.d (collaborative) deep learning
- With a complex target
- First hierarchical Bayesian models for hybrid deep recommender system
- Significantly advance the state of the art

Marginalized CDL

Transformation to latent factors

CDL:

$$\mathcal{L} = -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - f_e(\mathbf{X}_{0,j*}, \mathbf{W}^+)^T\|_2^2$$

$$- \frac{\lambda_n}{2} \sum_j \|f_r(\mathbf{X}_{0,j*}, \mathbf{W}^+) - \mathbf{X}_{c,j*}\|_2^2 - \sum_{i,j} \frac{C_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2$$

Reconstruction error

Transformation to latent factors

Marginalized CDL:

$$\mathcal{L} = -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j \mathbf{P}_1 - \mathbf{X}_{0,j*} \mathbf{W}_1\|_2^2$$

$$- \sum_j \|\tilde{\mathbf{X}}_{0,j*} \mathbf{W}_1 - \bar{\mathbf{X}}_{c,j*}\|_2^2 - \sum_{i,j} \frac{C_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2$$

Reconstruction error

Generative Process: Collaborative Deep Ranking

1. For each layer l of the SDAE network,
 - (a) For each column q , draw the weight matrix and bias vector W_l^+ , draw $W_{l,*q}^+ \sim \mathcal{N}(0, \lambda_w^{-1} I_{K_l})$.
 - (b) For each row j of X_l , draw $X_{l,j*} \sim \mathcal{N}(\sigma(X_{l-1,j*} W_l + b_l), \lambda_s^{-1} I_{K_l})$
2. For each item j ,
 - (a) Draw a clean input $X_{c,j*} \sim \mathcal{N}(X_{L,j*}, \lambda_n^{-1} I_m)$
 - (b) Draw a latent item offset vector $\epsilon_j \sim \mathcal{N}(0, \lambda_v^{-1} I_K)$ and then set the latent item vector to be:

$$v_j = \epsilon_j + X_{\frac{L}{2},j*}^T$$

3. For each user i ,
 - (a) Draw user factor vector $u_i \sim \mathcal{N}(0, \lambda_u^{-1} I_K)$
 - (b) For each pair-wise preference $(j, k) \in \mathcal{P}_i$, where $\mathcal{P}_i = \{(j, k) : r_{ij} - r_{ik} > 0\}$, draw the estimator,

$$\delta_{ijk} \sim \mathcal{N}(u_i^T v_j - u_i^T v_k, c_{ijk}^{-1})$$

Symmetric CDL

Both item content and user attributes

User attributes: age, gender, occupation, country, city, geolocation, domain, etc

[Li et al., CIKM 2015]

Symmetric CDL

Marginalized CDL:

$$\mathcal{L} = -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j \mathbf{P}_1 - \mathbf{X}_{0,j*} \mathbf{W}_1\|_2^2$$

$$- \sum_j \|\tilde{\mathbf{X}}_{0,j*} \mathbf{W}_1 - \bar{\mathbf{X}}_{c,j*}\|_2^2 - \sum_{i,j} \frac{C_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2$$

Item content

Symmetric CDL:

$$\mathcal{L} = -\frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j \mathbf{P}_1 - \mathbf{X}_{0,j*} \mathbf{W}_1\|_2^2 - \frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i \mathbf{P}_2 - \mathbf{Y}_{0,i*} \mathbf{W}_2\|_2^2$$

$$- \sum_j \|\tilde{\mathbf{X}}_{0,j*} \mathbf{W}_1 - \bar{\mathbf{X}}_{c,j*}\|_2^2 - \sum_i \|\tilde{\mathbf{Y}}_{0,i*} \mathbf{W}_2 - \bar{\mathbf{Y}}_{c,i*}\|_2^2 - \sum_{i,j} \frac{C_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2$$

BDL for Topic Models and Relational Learning

Relational SDAE as Relational Topic Models

Relational SDAE: Motivation

- Unsupervised representation learning
- Enhance representation power with **relational information**

Probabilistic SDAE

Graphical model:

Generative process:

$$\mathbf{W}_{l,*n} \sim \mathcal{N}(0, \lambda_w^{-1} \mathbf{I}_{K_l})$$

$$\mathbf{b}_l \sim \mathcal{N}(0, \lambda_w^{-1} \mathbf{I}_{K_l})$$

$$\mathbf{X}_{l,j*} \sim \mathcal{N}(\sigma(\mathbf{X}_{l-1,j*} \mathbf{W}_l + \mathbf{b}_l), \lambda_s^{-1} \mathbf{I}_{K_l})$$

$$\mathbf{X}_{c,j*} \sim \mathcal{N}(\mathbf{X}_{L,j*}, \lambda_n^{-1} \mathbf{I}_B)$$

Generalized SDAE

Notation:

- $\mathbf{x}_0$ corrupted input
- $\mathbf{x}_c$ clean input
- $\mathbf{W}^+$ weights and biases

Relational SDAE: Graphical Model

Notation:

- x_0 corrupted input
- x_c clean input
- A adjacency matrix

Relational SDAE: Two Components

Relational SDAE: Generative Process

- ① Draw the relational latent matrix $\mathbf{S}$ from a *matrix variate normal distribution*:

$$\mathbf{S} \sim \mathcal{N}_{K,J}(0, \mathbf{I}_K \otimes (\lambda_l \mathcal{L}_a)^{-1}).$$

- ② For layer l of the SDAE where $l = 1, 2, \dots, \frac{L}{2} - 1$,
 - ① For each column n of the weight matrix $\mathbf{W}_l$, draw $\mathbf{W}_{l,*n} \sim \mathcal{N}(0, \lambda_w^{-1} \mathbf{I}_{K_l})$.
 - ② Draw the bias vector $\mathbf{b}_l \sim \mathcal{N}(0, \lambda_w^{-1} \mathbf{I}_{K_l})$.
 - ③ For each row j of $\mathbf{X}_l$, draw

$$\mathbf{X}_{l,j*} \sim \mathcal{N}(\sigma(\mathbf{X}_{l-1,j*} \mathbf{W}_l + \mathbf{b}_l), \lambda_s^{-1} \mathbf{I}_{K_l}).$$

- ③ For layer $\frac{L}{2}$ of the SDAE network, draw the representation vector for item j from the product of two Gaussians (PoG):

$$\mathbf{X}_{\frac{L}{2},j*} \sim \text{PoG}(\sigma(\mathbf{X}_{\frac{L}{2}-1,j*} \mathbf{W}_l + \mathbf{b}_l), \mathbf{s}_j^T, \lambda_s^{-1} \mathbf{I}_K, \lambda_r^{-1} \mathbf{I}_K).$$

Relational SDAE: Generative Process

- ① For layer l of the SDAE network where $l = \frac{L}{2} + 1, \frac{L}{2} + 2, \dots, L$,
 - ① For each column n of the weight matrix $\mathbf{W}_l$, draw $\mathbf{W}_{l,*n} \sim \mathcal{N}(0, \lambda_w^{-1} \mathbf{I}_{K_l})$.
 - ② Draw the bias vector $\mathbf{b}_l \sim \mathcal{N}(0, \lambda_w^{-1} \mathbf{I}_{K_l})$.
 - ③ For each row j of $\mathbf{X}_l$, draw

$$\mathbf{X}_{l,j*} \sim \mathcal{N}(\sigma(\mathbf{X}_{l-1,j*} \mathbf{W}_l + \mathbf{b}_l), \lambda_s^{-1} \mathbf{I}_{K_l}).$$

- ② For each item j , draw a clean input

$$\mathbf{X}_{c,j*} \sim \mathcal{N}(\mathbf{X}_{L,j*}, \lambda_n^{-1} \mathbf{I}_B).$$

Multi-Relational SDAE: Graphical Model

Product of $Q+1$ Gaussians

Multiple networks:

citation networks
co-author networks

Notation:

- x_0 corrupted input
- x_c clean input
- A adjacency matrix

Relational SDAE: Objective Function

$$\mathcal{L} = -\frac{\lambda_l}{2} \text{tr}(\mathbf{S} \mathcal{L}_a \mathbf{S}^T) - \frac{\lambda_r}{2} \sum_j \|(\mathbf{s}_j^T - \mathbf{X}_{\frac{L}{2}, j*})\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2) \\ - \frac{\lambda_n}{2} \sum_j \|\mathbf{X}_{L, j*} - \mathbf{X}_{c, j*}\|_2^2 - \frac{\lambda_s}{2} \sum_l \sum_j \|\sigma(\mathbf{X}_{l-1, j*} \mathbf{W}_l + \mathbf{b}_l) - \mathbf{X}_{l, j*}\|_2^2.$$

Similar to the generalized SDAE, taking λ_s to infinity, the joint log-likelihood becomes:

$$\mathcal{L} = -\frac{\lambda_l}{2} \text{tr}(\mathbf{S} \mathcal{L}_a \mathbf{S}^T) - \frac{\lambda_r}{2} \sum_j \|(\mathbf{s}_j^T - \mathbf{X}_{\frac{L}{2}, j*})\|_2^2 - \frac{\lambda_w}{2} \sum_l (\|\mathbf{W}_l\|_F^2 + \|\mathbf{b}_l\|_2^2) \\ - \frac{\lambda_n}{2} \sum_j \|\mathbf{X}_{L, j*} - \mathbf{X}_{c, j*}\|_2^2,$$

Network **A** → Relational Matrix **S**

Relational Matrix **S** → Middle-Layer Representations

Update Rules

For $\mathbf{S}$:

$$\mathbf{S}_{k*}(t+1) \leftarrow \mathbf{S}_{k*}(t) + \delta(t)r(t)$$

$$r(t) \leftarrow \lambda_r \mathbf{X}_{\frac{L}{2},*k}^T - (\lambda_l \mathcal{L}_a + \lambda_r \mathbf{I}_J) \mathbf{S}_{k*}(t)$$

$$\delta(t) \leftarrow \frac{r(t)^T r(t)}{r(t)^T (\lambda_l \mathcal{L}_a + \lambda_r \mathbf{I}_J) r(t)}.$$

For $\mathbf{X}$, $\mathbf{W}$, and $\mathbf{b}$: Use Back Propagation.

From Representation to Tag Recommendation

Objective function:

$$\begin{aligned}\mathcal{L} = & -\frac{\lambda_u}{2} \sum_i \|\mathbf{u}_i\|_2^2 - \frac{\lambda_v}{2} \sum_j \|\mathbf{v}_j - \mathbf{X}_{\frac{L}{2}, j*}^T\|_2^2 \\ & - \sum_{i,j} \frac{c_{ij}}{2} (\mathbf{R}_{ij} - \mathbf{u}_i^T \mathbf{v}_j)^2,\end{aligned}$$

where λ_u and λ_v are hyperparameters. c_{ij} is set to 1 for the existing ratings and 0.01 for the missing entries.

Algorithm

1. Learning representation:

repeat

 Update $\mathbf{S}$ using the updating rules

 Update $\mathbf{X}$, $\mathbf{W}$, and $\mathbf{b}$

until convergence

Get resulting representation $\mathbf{X}_{\frac{L}{2}, j^*}$

2. Learning $\mathbf{u}_i$ and $\mathbf{v}_j$:

Optimize the objective function $\mathcal{L}$

3. Recommend tags to items according to the predicted $\mathbf{R}_{ij}$:

$$\mathbf{R}_{ij} = \mathbf{u}_i^T \mathbf{v}_j$$

Rank $\mathbf{R}_{1j}, \mathbf{R}_{2j}, \dots, \mathbf{R}_{Ij}$

Recommend tags with largest $\mathbf{R}_{ij}$ to item j

Case Study 1: Tagging Scientific Articles

An example article with recommended tags

Example Article	Title: Mining the Peanut Gallery: Opinion Extraction and Semantic Classification of Product Reviews			
	Top topic 1: language, text, mining, representation, semantic, concepts, words, relations, processing, categories			
Top 10 tags	SDAE	True?	RSDAE	True?
	1. instance	no	1. sentiment_analysis	no
	2. consumer	yes	2. instance	no
	3. sentiment_analysis	no	3. consumer	yes
	4. summary	no	4. summary	no
	5. 31july09	no	5. sentiment	yes
	6. medline	no	6. product_review_mining	yes
	7. eit2	no	7. sentiment_classification	yes
	8. l2r	no	8. 31july09	no
	9. exploration	no	9. opinion_mining	yes
	10. biomedical	no	10. product	yes

Precision: 10% VS 60%

Case Study 2: Tagging Movies (SDAE)

An example movie with recommended tags

Example Movie	Title: E.T. the Extra-Terrestrial	
	Top topic 1: crew, must, on, earth, human, save, ship, rescue, by, find, scientist, planet	
Top 10 recommended tags	SDAE	True tag?
	1. Saturn Award (Best Special Effects)	yes
	2. Want	no
	3. Saturn Award (Best Fantasy Film)	no
	4. Saturn Award (Best Writing)	yes
	5. Cool but freaky	no
	6. Saturn Award (Best Director)	no
	7. Oscar (Best Editing)	no
	8. almost favorite	no
	9. Steven Spielberg	yes
	10. sequel better than original	no

Precision: 30% VS 60%

Case Study 2: Tagging Movies (RSDAE)

An example movie with recommended tags

Example Movie	Title: E.T. the Extra-Terrestrial	
	Top topic 1: crew, must, on, earth, human, save, ship, rescue, by, find, scientist, planet	
Top 10 recommended tags	RSDAE	True tag?
	1. Steven Spielberg	yes
	2. Saturn Award (Best Special Effects)	yes
	3. Saturn Award (Best Writing)	yes
	4. Oscar (Best Editing)	no
	5. Want	no
	6. Liam Neeson	no
	7. AFI 100 (Cheers)	yes
	8. Oscar (Best Sound)	yes
	9. Saturn Award (Best Director)	no
	10. Oscar (Best Music - Original Score)	yes

Relational SDAE as Deep Relational Topic Models

BDL-Based Topic Models

**Unified into a probabilistic relational model
for relational deep learning**

Applications of Bayesian Deep Learning: Under a Principled Framework

Take-home Messages

- Probabilistic graphical models for formulating both representation learning and inference/reasoning components
- Learnable representation serving as a bridge
- Tight, two-way interaction is crucial

Future Goals

General Framework:

1. Ability of **understanding** text, images, and videos
2. Ability of **inference** and **planning** under uncertainty
3. Close the **gap** between human intelligence and artificial intelligence

Thanks!
